This problem can be solved using permutations counting techniques. We have 6 symbols in total but note that they are not distinct. For example if we have 6 different symbols then the number of permutations or different signals that we can generate is 6 factorial however in our case we have 3 symbols (R G B) and a 6 color signal so we need to divide the 6! over (3! x 2! x 1!). The final answer ...

Permutation or Combination? Students often struggle with deciding whether the problem required permutations or combinations. The key is to decide whether order must be considered or not when counting the possibilities. If order matters and selections may not be repeated, then you should use permutations (via the permutation formula). If order does not matter and selections may not be repeated ...

One can also use the combination formula for this problem: $n C r = n! / (n-r)! r!$ Therefore: $5 C 3 = 5! / 3! 2! = 10$ (Note: an example of a counting problem in which order would matter is a lock or passcode situation. The permutation 3-5-7 for a three number lock or passcode is a distinct outcome from 5-7-3, and thus both must be counted.)
